TITLE: Automation of physical experiments with polarized neutrons

SOURCE: Jaderna energie, v. 11, no. 9, 1965, 330-335 19, 44-5

TOPIC TAGS: circular polarization, gamma radiation, radiative capture, neutron, automation

ABSTRACT: A device is described that makes the apparatus for the measurement of circular polarization of gamma radiation from radiative capture of polarized neutrons on nuclei entirely automatic. Particular attention is aimed at problems having more general importance in the automation of physical experiments. This work was presented by J. Kopecky. Orig. art. has: 5 figures. /NA/

"Natriuretic Effect of Oxytocin in Premenstrual Tension."

Prague, Casopis Lekarů Ceskych, Vol 105, No 34, 26 Aug 66, pp 924 - 926

Abstract [Authors' English summary modified]: Oxytocin does not interfere with renal excretion of basic minerals in healthy subjects. In women suffering from premenstrual tension, with a detectably raised antidiuretic activity of blood, the administration of oxytocin increases urinary excretion of sodium. Intranasal administration is also effective and is recommended in ambulatory treatment of premenstrual tensions. 1 Figure, 5 Western, 1 Czech reference.

Title : The Role of Nerve Vagus in the Mobilization of Antidiuretic Hormones.
Orig Pub : Univ. carolina, Med., 1956, 2, No 3, 259-265.
Abstract : Five men received intravenous injections of a 15 percent NaCl solution in doses of 20 ml, given 2-3 hours after meals for the duration of 2 minutes. After 20 minutes, the blood's antidiuretic hormone (AH) content rose to 11-28 microunits per each ml of the serum (before NaCl was introduced, AH was not found in blood). On the next day the tests were repeated with the only variation that now a 0.5 mg

The inhibitory effect of atropine and benzedrine on the
liberation of antidiuretic hormone REV.CZECH.MED. 1956,
2/4 (346-349) Tables 2

- Antidiuretic hormone (ADH) which is released as a reaction to increased osmotic pressure or sudden lowering of circulating volume was studied in 10 healthy subjects after i.v. injection of hypertonic saline (20 ml. 15% NaCl) with Jeffers' method. 20 min. after the NaCl injection the ADH content of the serum had increased. Anticholinergics (atropine, 0.5 mg.) and adrenergic drugs (amphetamine, 10 mg.) prevented the release of ADH.

Coproporphyrins were extracted from the acidified urine with ethyl acetate. The extracts were washed and the coproporphyrins transferred into diluted HCl and determined by colorimetry in the Beckmann photometer at 4010 Å. For semi-quantitative determination a simple fluorometric method may be sufficient: To 2 ml. of urine are added 0.4 ml. of acetate buffer (4 parts of glacial acetic acid + 1 part of saturated Na acetate) and the mixture shaken with 10 ml. of ether. To 5 ml. of the ether phase are added 3-5 drops of 0.1% solution of iodine. After 10 min. 0.25 ml. of 2N HCl and after 10 min. 4.75 ml. of water are added with shaking. The intensity of the fluorescence is compared with standard solutions of coproporphyrin in HCl. As a source of UV-light a mercury vapour lamp with a fluid filter containing copper-ammonium complex may be used. Heyrovský - Prague

3261. HOLEČEK V. and ŠKRAMOVSKÝ S. Úst. Hyg. Práce a Chor. Povolání, Praha. Stanovení methemoglobinu v krvi. Determination of methaemoglobin in blood PRACOVNI LÉKARSTVI (Praha) 1956, 8/2 (128-132) Graphs 2 Tables 1

A modification of the cyanide method (see Noverraz: Schweiz. Med. Wschr. 1951, 81, 252) is the most suitable for routine use. To 25 ml. of a 1/60 M phosphate buffer pH 6.6 containing 0.3% saponin and 2 drops of 10% potassium oxalate is added 1 ml. of freshly drawn blood. The mixture is poured into two 0.5 cm. thick vessels of the Pulfrich photometer. To one vessel 1 drop of 6.5% neutral KCN solution is added and the extinction at 6100 Å. (D_1) is read after 2 min. against the 2nd vessel. To both vessels 1 drop of 12% potassium ferricyanide is added and a 2nd reading (D_2) is then taken after 2 min. The percentage of methaemoglobin is then calculated from the formula: %Mhb = $\frac{D_1}{D_2} \cdot 100$. The method permits the determination of normal Mhb levels with most of the current photometers.

HOLECEK V.

3136. HOLECEK V. Ustav Hyg. Práce a Chorob z Povolání, Praha. Vylučování koproporfyriu moci pri otrave olovem. I. Hladina prekursoru koproporfyriu a preformovaného koproporfyriu v cerstvé moci *Urinary excretion of coproporphyrins in lead poisoning. Levels in fresh urine* Pracovní Lékarství (Praha) 1956, 8/5 (333—336) Tables 3

The total coproporphyrin (I) in fresh urine in lead poisoning is composed of 1-12% preformed I and 88-99% I-precursor(s). This is the highest value for I-precursor so far reported. No evidence of an increased excretion of preformed I in lead poisoning could be obtained; the increased urinary level is due to increased excretion of precursor(s). After rapid voiding of urine the precursor is quickly converted to I in the dark in presence of oxygen. On exposure to light there is rapid breakdown to non-porphyrin substances. In urine in a test tube exposed to diffuse daylight, the total I content dropped to a small percentage of the original value after only 2 hr. Samples for analysis must therefore not be exposed to light, even for short periods.

II. The Level of Coproporphyrin I and III Isomers in
Urine.

Orig Pub : Pracovni lekar., 1956, 8, No 6, 415-419.

Abstract : A study was made of the coproporphyrin precursor level in the urine of healthy subjects and of those suffering from lead poisoning. Methyl ethers of porphyrin were extracted from the urine by various methods. Coproporphyrin was separated by column chromatography and its isomers, I and II, by paper chromatography. It was found that in lead poisoning the urine contained predominantly a precursor of coproporphyrin III and only a small amount of coproporphyrin I precursor. Coproporphyrins I and III were found in

Title : The Antidiuretic Effect of Pyrazolone Derivatives, Their Mode of Action and Clinical Significance.

Orig Pub : Casop. lekaru ceskych, 1956, 95, No 11, 300-305.

Abstract : An antidiuretic effect of irgapine and butylpyrine was studied in experiments on mice and in observations on 50 patients. Edema appeared in 6 out of 50 patients. The use of these drugs is not recommended in diseases accompanied by edema. Their antidiuretic effect is attributed to the stimulation of the tubular reabsorption of water.

Abstract [English summary modified]: Detailed clinical data on 200 women with metastatic mammary carcinoma; treated with androgens (and their predominantly anabolizing derivatives) as well as estrogens and phased removal of various endocrine glands. Average survival was 22 months after metastases were diagnosed. Palliation is considered worthwhile since no other measures are available. Five graphs.

TITLE: Preparation of pentaerythritol by a batch process

SOURCE: Chemické zvesti, no. 11, 1964, 867-871

TOPIC TAGS: pentaerythritol, solution property, acetaldehyde, formaldehyde, calcium oxide, chemical engineering

ABSTRACT: The quantitative yield of technical pentaerythritol in a batch process was investigated as a function of the molar ratio and concentration of the aldehydes. In the region of molar proportions acetaldehyde: formaldehyde: calcium oxide of 1:4:0.6 to 1:5.5:0.6 the connection between yield and the parameters mentioned was investigated, while maintaining a process that can be used practically. Maximum yield was obtained at a molar ratio of 1:5 and at a concentration 7%.
